

Does your loved one have juvenile myoclonic epilepsy?

You may be eligible to participate in a research study.

ABOUT THIS STUDY

This research study's goal is to gain an understanding of the unique challenges faced by individuals with juvenile myoclonic epilepsy throughout midlife.

WHAT WILL PARTICIPANTS DO?

- Study visits will involve a two-hour evaluation featuring memory, problem solving and behavior paper and pencil tests.
- Caregivers will undergo assessment at the first study visit, and answer questions at the other study visits.

WHO CAN VOLUNTEER?

- Adults between the ages of 45 and 65, who speak English, and with no history of learning disability, head trauma, cardiac condition or neurological disease.
- Participants must not have been hospitalized for major depressive disorder in the past year.
- It is preferred that participants have an available loved one or caregiver, between the ages of 45 and 65, who will agree to participate in the study.
